Analyze Survey Results

REVIEW

HISTORY

Meets Specifications

Ready to go!

You did a great job! The project meets all the requirements!
Keep being awesome!

Submission Phase

A PDF report has been uploaded and a excel workbook has been uploaded in a single zipped folder file

All required file was submitted ☐

Exploration Phase

The project clearly states four or more questions, then addresses those questions in the rest of the analysis.
The solutions to the questions should range in being found from a single column to being found using multiple columns.

At least one question/solution must make use of multiple columns.

You did great work you use four questions in your analysis □

Student uses means, medians, and modes to generate insights.

Stating the mean, median, and mode is insufficient. Please include in the written description a short insight related to each one.

For example here is an insight based on median:

The median number of hours slept by survey respondents who were employed was 4 hours. The median number of hours slept by unemployed survey respondents was 12. It looks like those who are unemployed get much more sleep based on the median.

(this data is fake for this example)

You did great work you use a measure of center in insights □

Student uses standard deviation and range to generate insights.

Stating the standard deviation and range is insufficient. Please include in the written description a short insight related to each one.

For an example, please review the finished slide example in the classroom, which can be found in the Analyze Survey Data project lesson (concept 7: Finished Example Slide).

Good job you use the measure of spread in your insights □

Student uses at least two different plots to explore the data. These plots may include histograms, box-plots, scatterplots, and bar charts to explore data and gain insights.

All slides must contain a visualization. Screenshots of values in a table does not count.

Excellent work when you use different plots to represent your analyses □

An appropriate visual is chosen to present the data. All labels are legible and the visual has appropriate axis labels.

Every visualization should have

- chart title
- x axis title
- x axis labels
- y axis title

- y axis labels

Please refer to the finished slide example page in the classroom for an example.

All was clear ☐

Communication Phase

The results of the analysis are presented such that any limitations are clear. The analysis does not state or imply that one change causes another based solely on a correlation.

The results do not imply facts about a larger group of individuals based on descriptive values. Language is only applied to the specific data provided. Unless a correct analysis beyond the course material is conducted that allows for inference.

This data is from Survey Respondents and is not from the entire Udacity Student population. This must be acknowledged at least once in the submission.

Good job you mention this limitation in your report ☐

The analysis associated with answering a particular question uses the appropriate variables, summary statistics, and plots that could provide an answer.

Well done perfectly ☐
